MTH 1126 - Test #4 - Solutions

Spring 2024 - 9am Class

Pat Rossi

Name _____

Show CLEARLY how you arrive at your answers.

In Exercises 1-2, Determine convergence/divergence. If the integral converges, find its value.

1.
$$\int_{5}^{\infty} \frac{1}{(x-1)^{\frac{3}{2}}} dx =$$

$$\frac{u}{\frac{du}{dx}} = 1$$

$$\frac{du}{\frac{du}{du}} = dx$$
When $x = 5$; $u = x - 1 = 4$
When $x = \infty$; $u = x - 1 = \infty$

$$\int_{x=5}^{x=\infty} \frac{1}{(x-1)^{\frac{3}{2}}} dx = \int_{u=4}^{u=\infty} \frac{1}{u^{\frac{3}{2}}} du = \lim_{b\to\infty} \int_{u=4}^{u=b} u^{-\frac{3}{2}} du = \lim_{b\to\infty} \left[\frac{u^{-\frac{1}{2}}}{-\frac{1}{2}} \right]_{u=4}^{u=b} = \lim_{b\to\infty} \left[-\frac{2}{u^{\frac{1}{2}}} \right]_{u=4}^{u=b}$$

$$= \lim_{b\to\infty} \left[-\frac{2}{b^{\frac{1}{2}}} - \left(-\frac{2}{4^{\frac{1}{2}}} \right) \right] = 0 - (-1) = 1$$
i.e.,
$$\int_{5}^{\infty} \frac{1}{(x-1)^{\frac{3}{2}}} dx = 1$$
 (Integral Converges)

2. $\int_{5}^{14} \frac{1}{(x-5)^{\frac{1}{2}}} dx =$

(Because $\frac{1}{(x-5)^{\frac{1}{2}}}$ is discontinuous at x = 5, this is an improper integral.)

$$\begin{aligned} u &= x-5\\ \frac{du}{dx} &= 1\\ du &= dx \end{aligned}$$
When $x = 5; \ u = x-5 = 0$
When $x = 14; \ u = x-5 = 9$

$$\int_{x=5}^{x=14} \frac{1}{(x-5)^{\frac{1}{2}}} dx = \int_{u=0}^{u=9} \frac{1}{u^{\frac{1}{2}}} du = \int_{u=0}^{u=9} u^{-\frac{1}{2}} du = \lim_{a \to 0^+} \int_{u=a}^{u=9} u^{-\frac{1}{2}} du = \lim_{a \to 0^+} \left[\frac{u^{\frac{1}{2}}}{\frac{1}{2}} \right]_{u=a}^{u=9} = \lim_{a \to 0^+} \left[2u^{\frac{1}{2}} \right]_{u=a}^{u=9}$$

$$= \lim_{a \to 0^+} \left[2(9)^{\frac{1}{2}} - 2(a)^{\frac{1}{2}} \right] = \left[2(3) - 2(0) \right] = 6$$

i.e. $\int_{5}^{14} \frac{1}{(x-5)^{\frac{1}{2}}} dx = 6$ (Integral **Converges**)

3. Determine convergence/divergence of the sequence whose n^{th} term is given by:

$$a_n = \frac{2n}{n+1}.$$

(i.e., Determine convergence/divergence of the sequence:

$$\left\{\frac{2n}{n+1}\right\}_{n=1}^{\infty} = \left\{1, \frac{4}{3}, \frac{3}{2}, \frac{8}{5}, \frac{5}{3}, \frac{12}{7}, \dots, \frac{2n}{n+1}, \dots\right\}.\right)$$

Observe: $\lim_{n\to\infty} a_n = \lim_{n\to\infty} \frac{2n}{n+1} = \lim_{n\to\infty} \frac{2n}{n} = \lim_{n\to\infty} 2 = 2$

Since $\lim_{n\to\infty} a_n$ is a finite real number, the sequence converges to that limit.

$$\left\{\frac{2n}{n+1}\right\}_{n=1}^{\infty}$$
 converges to 2.

4. Determine convergence/divergence of the given series. (Justify your answer!) If the series converges, determine its sum.

$$\sum_{n=3}^{\infty} \frac{4}{n^2 - 4} = \frac{4}{5} + \frac{4}{12} + \frac{4}{21} + \dots$$

"If the series converges, determine its sum." In general, there are only two types of convergent series whose sums we can compute: Geometric and "Telescoping (Collapsing) Sum."

The series
$$\sum_{n=3}^{\infty} \frac{4}{n^2-4}$$
 is definitely NOT Geometric.

Maybe it can be written as a "Telescoping (Collapsing) Sum."

So let's see if we can express $a_n = \frac{4}{n^2 - 4}$ as the difference of two terms.

$$\begin{split} &\frac{4}{n^2-4} = \frac{4}{(n-2)(n+2)} = \frac{C_1}{n-2} + \frac{C_2}{n+2} \\ &\text{i.e., } \frac{4}{(n-2)(n+2)} = \frac{C_1}{n-2} + \frac{C_2}{n+2} \\ &\Rightarrow \frac{4}{(n-2)(n+2)} (n-2) (n+2) = \frac{C_1}{n-2} (n-2) (n+2) + \frac{C_2}{n+2} (n-2) (n+2) \\ &\Rightarrow 4 = C_1 (n+2) + C_2 (n-2) \\ \hline \hline n=2 \quad \Rightarrow 4 = C_1 (4) \\ &\implies C_1 = 1 \\ \hline \hline n=-2 \quad \Rightarrow 4 = C_2 (-4) \\ &\implies C_2 = -1 \\ \hline \text{Thus, } \frac{4}{n^2-4} = \frac{1}{n-2} - \frac{1}{n+2} \\ &\Rightarrow \sum_{n=3}^{N} \frac{4}{n^2-4} = \sum_{n=3}^{N} \left(\frac{1}{n-2} - \frac{1}{n+2}\right) = \left(1 - \frac{1}{5}\right) + \left(\frac{1}{2} - \frac{1}{6}\right) + \left(\frac{1}{3} - \frac{1}{7}\right) + \left(\frac{1}{4} - \frac{1}{8}\right) + \left(\frac{1}{5} - \frac{1}{9}\right) \\ &\qquad + \left(\frac{1}{6} - \frac{1}{10}\right) + \left(\frac{1}{7} - \frac{1}{11}\right) + \ldots + \left(\frac{1}{N-7} - \frac{1}{N-3}\right) + \left(\frac{1}{N-6} - \frac{1}{N-2}\right) + \left(\frac{1}{N-5} - \frac{1}{N-1}\right) \\ &\qquad + \left(\frac{1}{N-4} - \frac{1}{N}\right) + \left(\frac{1}{N-3} - \frac{1}{N+1}\right) + \left(\frac{1}{N-2} - \frac{1}{N+2}\right) \\ &= 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots - \frac{1}{N-1} - \frac{1}{N-1} - \frac{1}{N+1} - \frac{1}{N+2} \\ \hline \text{i.e. } \sum_{n=3}^{N} \left(\frac{1}{n-2} - \frac{1}{n+2}\right) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots - \frac{1}{N-1} - \frac{1}{N} - \frac{1}{N+1} - \frac{1}{N+2} \end{split}$$

Consequently:

$$\sum_{n=3}^{\infty} \frac{4}{n^2 - 4} = \lim_{N \to \infty} \sum_{n=3}^{N} \left(\frac{1}{n-2} - \frac{1}{n+2} \right)$$
$$= \lim_{N \to \infty} \left(1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots - \frac{1}{N-1} - \frac{1}{N} - \frac{1}{N+1} - \frac{1}{N+2} \right) = \frac{25}{12}$$
i.e.,
$$\sum_{n=3}^{\infty} \frac{4}{n^2 - 4}$$
 converges and is equal to $\frac{25}{12}$

In Exercises 5-6, determine convergence/divergence of the given series. (Justify your answers!) If the series converges, determine its sum.

5. $1 + \frac{2}{5} + \frac{4}{25} + \frac{8}{125} + \ldots + \left(\frac{2}{5}\right)^n + \ldots$

"If the series converges, determine its sum." In general, there are only two types of convergent series whose sums we can compute: Geometric and "Telescoping Sum."

Notice that each term after the first term is equal to $\frac{4}{5}$ times its predecessor.

The series is geometric with ratio $r = \frac{2}{5}$

Since |r| < 1, the series converges to $\frac{1^{\text{st term}}}{1-r} = \frac{1}{1-\frac{2}{5}} = \frac{1}{\left(\frac{3}{5}\right)} = \frac{5}{3}$

The series **converges** to $\frac{5}{3}$

$$6. \sum_{n=1}^{\infty} \frac{n}{5n+1} =$$

First, note that $\lim_{n\to\infty} a_n = \lim_{n\to\infty} \frac{n}{5n+1} = \frac{1}{5}$

Since $\lim_{n\to\infty} a_n \neq 0$, the series **diverges.**

i.e., $\sum_{n=1}^{\infty} \frac{n}{5n+1}$ diverges by the "*n*th term Test."

In Exercises 7-9, determine convergence/divergence of the given series. (Justify your answers!)

7.
$$\sum_{n=1}^{\infty} \frac{1}{3n^2 - 1}$$

There are a few different ways that we can try to do this.

We can compare $\sum_{n=1}^{\infty} \frac{1}{3n^2-1}$ to $\sum_{n=1}^{\infty} \frac{1}{n^2}$, which is a convergent *p*-series with p = 2 > 1.

Since
$$\underbrace{\frac{1}{3n^2-1}}_{a_n} < \underbrace{\frac{1}{n^2}}_{b_n}$$
 and $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges, $\sum_{n=1}^{\infty} \frac{1}{3n^2-1}$ converges by the **Direct Com-**

parison Test.

(i.e. the fact that the "larger series" converges implies that the "smaller series" converges also.)

i.e.,
$$\sum_{n=4}^{\infty} \frac{1}{3n^2-1}$$
 diverges by the Direct Comparison with $\sum_{n=4}^{\infty} \frac{1}{n^2}$

Alternatively, we can use the **Limit** Comarison Test.

Observe:
$$\lim_{n \to \infty} \left| \frac{a_n}{b_n} \right| = \lim_{n \to \infty} \left| \frac{\left(\frac{1}{3n^2 - 1}\right)}{\left(\frac{1}{n^2}\right)} \right| = \lim_{n \to \infty} \frac{n^2}{3n^2 - 1} = \lim_{n \to \infty} \frac{n^2}{3n^2} = \frac{1}{3}$$

Since $0 < \lim_{n \to \infty} \left| \frac{a_n}{b_n} \right| < \infty$, Both series "do the same thing."

Since
$$\sum_{n=4}^{\infty} \frac{1}{n^2}$$
, is a convergent *p*-series (with $p=2$), $\sum_{n=4}^{\infty} \frac{1}{3n^2-1}$ converges also, by the

Limit Comparison Test.

i.e.,
$$\sum_{n=4}^{\infty} \frac{1}{3n^2-1}$$
 diverges by the Limit Comparison Test with $\sum_{n=4}^{\infty} \frac{1}{n^2}$

$$8. \sum_{n=1}^{\infty} \frac{1}{n+2}$$

There may be a few ways to do this.

First, we can compare
$$\sum_{n=1}^{\infty} \frac{1}{n+2}$$
 with $\sum_{n=1}^{\infty} \frac{1}{n}$, which is the divergent Harmonic Series.

Since $\frac{1}{\underbrace{n+2}} < \underbrace{\frac{1}{n}}_{b_n}$ and $\sum_{n=1}^{\infty} \frac{1}{n}$ diverges, we can conclude nothing from the Direct

Comparison Test.

(i.e., since the "larger series" diverges, this tells us nothing about the "smaller series.") Alternatively: Applying the Limit Comparison Test, we have:

 $\lim_{n \to \infty} \left| \frac{a_n}{b_n} \right| = \lim_{n \to \infty} \left| \frac{\left(\frac{1}{n+2}\right)}{\left(\frac{1}{n}\right)} \right| = \lim_{n \to \infty} \frac{n}{n+2} = 1$

Since $0 < \lim_{n \to \infty} \left| \frac{a_n}{b_n} \right| < \infty$, Both series "do the same thing."

Since $\sum_{n=1}^{\infty} \frac{1}{n}$, is the divergent Harmonic Series, $\sum_{n=1}^{\infty} \frac{1}{n+2}$ diverges also, by the **Limit**

Comparison Test.

Alternatively:
$$\int_{1}^{\infty} \frac{1}{n+2} dn = \lim_{b \to \infty} \int_{1}^{b} \underbrace{\frac{1}{n+2}}_{\frac{1}{u}} \underbrace{dn}_{du} = \lim_{b \to \infty} \left[\ln \left(n+2\right)\right]_{1}^{b}$$
$$= \lim_{b \to \infty} \left[\ln \left(b+2\right) - \ln \left(1+2\right)\right] = \infty$$

 $\sum_{n=1}^{\infty} \frac{1}{n+2}$ diverges by the Integral Test

Alternatively: $\sum_{n=1}^{\infty} \frac{1}{n+2} = \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \dots$ is the Harmonic Series with the first two terms deleted. Since the Harmonic Series diverges, **this series diverges** also, because adding or deleting finitely many terms from a series does not change whether the series converges or diverges.

9. Determine convergence/divergence of the given series. (Justify your answer!)

$$\sum_{n=1}^{\infty} \left(-1\right)^{n+1} \frac{1}{2n+1} = \frac{1}{3} - \frac{1}{5} + \frac{1}{7} - \frac{1}{9} + \dots$$

Observe: $^{1} \lim_{n \to \infty} a_{n} = \lim_{n \to \infty} \frac{1}{2n+1} = 0$ **Also:** $\frac{1}{2n+1} > \frac{1}{2(n+1)+1}$ i.e. $a_{n} > a_{n+1}$

Finally: the series is alternating.

By the Alternating Series Test, the series
$$\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{2n+1}$$
 converges

10. Determine convergence/divergence of the given series. (Justify your answer!)

$$\sum_{n=1}^{\infty} \left(\frac{n+3}{5n+1}\right)^n$$

The n^{th} term, a_n is something raised to the n^{th} power, so this series is a good candidate for the n^{th} Root Test.

Observe: $\lim_{n \to \infty} \sqrt[n]{|a_n|} = \lim_{n \to \infty} \sqrt[n]{\left(\frac{n+3}{5n+1}\right)^n} = \lim_{n \to \infty} \left(\frac{n+3}{5n+1}\right) = \lim_{n \to \infty} \left(\frac{n}{5n}\right)$ $= \lim_{n \to \infty} \left(\frac{1}{5}\right) = \frac{1}{5}$

i.e., $\lim_{n\to\infty} \sqrt[n]{|a_n|} = \frac{1}{5}$

Since $\lim_{n\to\infty} \sqrt[n]{|a_n|} < 1$, the series **converges.** by the n^{th} **Root Test.**

 $\sum_{n=1}^{\infty} \left(\frac{n+3}{5n+1}\right)^n$ converges by the n^{th} Root Test.

11. Determine convergence/divergence of the given series. (Justify your answer!)

$$\sum_{n=1}^{\infty} \frac{2^n}{n!}$$

The n^{th} term a_n contains a **factorial**, so this is a good candidate for the **Ratio Test**.

Observe: $\lim_{n \to \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \to \infty} \left| \frac{\frac{2^{n+1}}{(n+1)!}}{\left(\frac{2^n}{n!}\right)} \right| = \lim_{n \to \infty} \frac{2^{n+1}}{(n+1)!} \frac{n!}{2^n} = \lim_{n \to \infty} \frac{2}{(n+1)} = 0$

Since $\lim_{n\to\infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$, the series **converges.**

 $\sum_{n=1}^{\infty} \frac{2^n}{n!}$ converges by the Ratio Test.
